Let $y(x)=f(x)+\lambda \int_{a}^{x} K(x, t) y(t) d t$ be given Volterra integral equation of the second kînữ. Suppose that
(i) Kernel $K(x, t) \neq 0$, is real and continuous in the rectangle $R$ for which $a \leq x \leq b, a \leq t \leq b$. Also, let $|K(x, t)| \leq M$, in $R$
(2)
(ii) The function $f(x) \neq 0$, is real and continuous in the interval $I$, for which $a \leq x \leq b$. Also, let $|f(x)| \leq N$, in $I$
(iii) The $\lambda$ is a constant
(3)
(4)

Therefore, the equation (1) has a unique solution in Isand above equation (1) is given by the absolutely and uniformly convergent series

$$
\left.y(x)=f(x)+\lambda \int_{a}^{x} K(x, t) f(t) d t+\lambda^{2} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) f\left(t_{1}\right) d t, t\right)
$$

Rewriting equation(1), we have

$$
\begin{equation*}
y(x)=f(x)+\lambda \int_{\sim}^{x} K\left(x, t_{1}\right) y\left(t_{1}\right) d t_{1} \tag{6}
\end{equation*}
$$

Replacing $x$ by $t$ in equation (6), we have

$$
\begin{equation*}
y(t)=f(t)+\lambda \int_{a}^{a} K\left(t, t_{1}\right) y\left(t_{1}\right) d t_{1} \tag{7}
\end{equation*}
$$

Putting the above value of $y(t)$ in equation (1), we obtering

$$
\begin{equation*}
y(x)=f(x)+\lambda \int_{a}^{x} K(x, t)\left[f(t)+\lambda \int_{a}^{x} K\left(t, t_{1}\right) y\left(t_{1}\right) d t_{1}\right] d t \tag{8}
\end{equation*}
$$

Re-writing equation (7), we have

$$
\begin{equation*}
y(t)=f(t)+\lambda \int_{a}^{x} K\left(t, t_{2}\right) y\left(t_{2}\right) d t_{2} \tag{9}
\end{equation*}
$$

$$
y\left(t_{1}\right)=f\left(t_{1}\right)+\lambda \int_{a}^{x} K\left(t_{1}, t_{2}\right) y\left(t_{2}\right) d t_{2}
$$

Replacing $t$ by $t_{1}$ in equation (9), we have

Substituting the above value of $y\left(t_{1}\right)$ in equation (8), we wet

$$
\begin{aligned}
& y(x)=f(x)+\lambda \int_{a}^{x} K(x, t) f(t) d t+\lambda^{2} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) f\left(t_{1}\right) d t_{1} d t \\
& +\lambda^{3} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) \int_{a}^{t_{1}} K\left(t_{1}, t_{2}\right) y\left(t_{2}\right) d t_{2} d t_{1} d t \ldots
\end{aligned}
$$

Proceeding the same as above, we have

$$
\begin{align*}
& y(x)=f(x)+\lambda \int_{a}^{x} K(x, t) f(t) d t+\lambda^{2} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) f\left(t_{1}\right) d t_{1} d t \\
& +\lambda^{n} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) \ldots \int_{a}^{t_{n-2}} K\left(t_{n-2}, t_{n-1}\right) f\left(t_{n-1}\right) d t_{n-1} \ldots d t_{1} d \bar{t} \\
& \quad+R_{n+1}(x),
\end{align*}
$$

where

$$
R_{n+1}(x)=\lambda^{n+1} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) \ldots \int_{a}^{t_{n-1}} K\left(t_{n-1}, t_{n}\right) y\left(t_{n}\right) d t_{n} \ldots d t_{1} d t
$$

Now, let us consider the infinite series

$$
\begin{equation*}
f(x)+\lambda \int_{a}^{x} K(x, t) f(t) d t+\lambda^{2} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) f\left(t_{1}\right) d t_{1} d t+\cdots \tag{14}
\end{equation*}
$$

In view of the assumptions (i) and (ii), each term oftthe series equation (14) is continuous in interval $I$. It follows that the series equation (14) is continuous in $I$, then its converges uniformly in $I$.

## Let

$V_{n}(x)=\lambda^{n} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) \ldots \int_{a}^{t_{n-2}}$

From equation (15), we have

$$
\begin{align*}
& \left|V_{n}(x)\right| \leq\left|\lambda^{n}\right| N M^{n} \frac{(x-a)^{n}}{n!} \quad \text { Using eq.(2) and (3) } \\
& \left|V_{n}(x)\right| \leq\left|\lambda^{n}\right| N M^{n} \frac{(b-a)^{n}}{n!}, \quad a \leq x \leq b \\
& \left|V_{n}(x)\right| \leq\left|\lambda^{n}\right| \frac{N[M(b-a)]^{n}}{n!}, \quad a \leq x \leq b
\end{align*}
$$

Clearly, the series for which the positive constant
$\left|\lambda^{n}\right| \frac{N[M(b-a)]^{n}}{n!}$ is the general expression for the nth termey
is convergent for all values of $\lambda, N, M,(b-a)$. $n!$

Therefore, from equation (16), it follows that the series
equation (14) converges absolutely and uniformly. Iffee. (1) has a continuous solution, it must be expressed by eq.(12). If $y(x)$ is continuous in $I,|y(x)|$ must have a maximum value $Y$. Therefore $|y(x)| \leq Y$

Now, from equation (13), we have

$$
\begin{aligned}
& \left|R_{n+1}(x)\right|=\left|\lambda^{n+1} \int_{a}^{x} K(x, t) \int_{a}^{t} K\left(t, t_{1}\right) \ldots \int_{a}^{t_{n-1}} K\left(t_{n-1}, t_{n}\right) y\left(t_{n}\right) d t_{n} \ldots d t_{1} d t\right| \\
& \left|R_{n+1}(x)\right| \leq \frac{|\lambda|^{n+1} Y M^{n+1}(x-a)^{n+1}}{(n+1)!}
\end{aligned}
$$

$$
\left|R_{n+1}(x)\right| \leq \frac{|\lambda|^{n+1} Y M^{n+1}(b-a)^{n+1}}{(n+1)!},(a \leq x \leq b)
$$

Hence $\lim _{n \rightarrow \infty} R_{n+1}(x)=0$.
It follows that the function $y(x)$ satisfying equation (1) the continuous function given by the series eq. (14).
Q. Determine the resolvent kernels for the Fredholm integral equation having kernels:

$$
\text { (i) } K(x, t)=e^{x+t}, a=0, b=1
$$

(ii) $K(x, t)=(1+x)(1-t), a=-1, b=1$

## Sol: We know that iterated kernels $K_{m}(x, t)$

$$
\begin{gather*}
K_{1}(x, t)=K(x, t)  \tag{1}\\
K_{m}(x, t)=\int_{0}^{1} K(x, z) K_{m-1}(z, t) d z \tag{2}
\end{gather*}
$$

From equation (1) $\quad K_{1}(x, t)=K(x, t)=e^{x+t}$
Putting $n=2$ in equation (2), we have

$$
\begin{align*}
& K_{2}(x, t)=\int_{0}^{1} K(x, z) K_{1}(z, t) d z \\
& K_{2}(x, t)=e^{x+t}\left(\frac{e^{2}-1}{2}\right) \tag{4}
\end{align*}
$$

Putting $n=3$ in equation (2), we have

$$
\begin{align*}
& K_{3}(x, t)=\int_{0}^{1} K(x, z) K_{2}(z, t) d z \\
& K_{3}(x, t)=e^{x+t}\left(\frac{e^{2}-1}{2}\right)^{2} \tag{5}
\end{align*}
$$

as before ..... .....and so on. Now, observing the equation (3), (4) an du
(5), we may write

$$
\begin{equation*}
K_{m}(x, t)=e^{x+t}\left(\frac{e^{2}-1}{2}\right)^{m-1}, m=1,2,3 \ldots \ldots \tag{6}
\end{equation*}
$$

Now, the required resolvent kernel is given by

$$
\begin{aligned}
& R(x, t ; \lambda)=\sum_{m=1}^{\infty} \lambda^{m-1} K_{m}(x, t)=\sum_{m=1}^{\infty} \lambda^{m-1} e^{x+t}\left(\frac{e^{2}-1}{2}\right)^{m-1} \\
& R(x, t ; \lambda)=e^{x+t} \sum_{m=1}^{\infty}\left[\lambda\left(\frac{e^{2}-1}{2}\right)\right]^{m-1} \\
& \text { But } \sum_{m=1}^{\infty}\left[\lambda\left(\frac{e^{2}-1}{2}\right)\right]^{m-1}=1+\lambda\left(\frac{e^{2}-1}{2}\right)+\left\{\lambda\left(\frac{e^{2}-1}{2}\right)\right\}^{2}+\cdots
\end{aligned}
$$

Which is an infinite geometric series with common ratio $\lambda\left(\frac{e^{2}-1}{2}\right)$
Therefore,

$$
\begin{equation*}
\sum_{m=1}^{\infty}\left[\lambda\left(\frac{e^{2}-1}{2}\right)\right]^{m-1}=\frac{2}{\left(2-\lambda\left(e^{2}-1\right)\right)} \tag{8}
\end{equation*}
$$

$$
\begin{equation*}
\text { Provided } \quad\left|\lambda\left(\frac{e^{2}-1}{2}\right)\right|<1 \tag{9}
\end{equation*}
$$

Now, using equation (8) and (9), equation (7) reduces to

$$
R(x, t ; \lambda)=\frac{2 e^{x+t}}{\left(2-\lambda\left(e^{2}-1\right)\right)} \text { Provided } \quad|\lambda|<\frac{2}{e^{2}-1}
$$

Question: Solve the following integral equation by the
method of successive approximations
(1) $y(x)=\frac{5 x}{6}+\frac{1}{2} \int_{0}^{1} x t y(t) d t$

(2) $\quad y(x)=x+\lambda \int_{0}^{1} x t y(t) d t$
(3) $y(x)=\sin x-\frac{x}{4}+\frac{1}{4} \int_{0}^{1} x t y(t) d t$
(4) $y(x)=\frac{3}{2} e^{x}-\frac{1}{2} x e^{x}-\frac{1}{2}+\frac{1}{2} \int_{0}^{1} t y(t) d t$
